

Labsheet 4 : Java Servlet

Lab Task 1: Simple Servlet - Display Static Message

1. Create a Java Servlet (DisplayMessageServlet) that outputs a static message.
2. Configure the servlet using the @WebServlet annotation or the web.xml deployment descriptor.

```
import java.io.IOException;

import java.io.PrintWriter;

import javax.servlet.ServletException;

import javax.servlet.annotation.WebServlet;

import javax.servlet.http.HttpServlet;

import javax.servlet.http.HttpServletRequest;

import javax.servlet.http.HttpServletResponse;

@WebServlet("/displayMessage")

public class DisplayMessageServlet extends HttpServlet {

    protected void doGet(HttpServletRequest request, HttpServletResponse response)

        throws ServletException, IOException {

        response.setContentType("text/html");

        PrintWriter out = response.getWriter();

        out.println("<html><body>");

        out.println("<h1>Welcome to the Java Servlet Lab!</h1>"); out.println("</body></html>");

    }

}
```

Deployment Descriptor (web.xml) (if not using annotations):

```
<?xml version="1.0" encoding="UTF-8"?>

<root>

  <web-app xmlns="http://java.sun.com/xml/ns/javaee"
version="3.0">

    <servlet>

      <servlet-name>DisplayMessageServlet</servlet-name> <servlet-
class>com.example.DisplayMessageServlet</servlet-class> </servlet>

    <servlet-mapping>

      <servlet-name>DisplayMessageServlet</servlet-name>

      <url-pattern>/displayMessage</url-pattern>

    </servlet-mapping>

  </web-app>

</root>
```

Lab Task 2: Get User Input from Form and Display

Create an HTML form to collect the user's name. Create a Servlet (GetUserInputServlet) to handle the form submission and display the user's name.

```
<!DOCTYPE html>

<html>

<head><title>Input Form</title></head>

<body>

  <form action="getUserInput" method="POST">

    Name: <input type="text" name="username" required><br> <input type="submit"
    value="Submit">

  </form>

</body>

</html>
```

Servlet Code (GetUserInputServlet.java):

```
package com.example;

import java.io.IOException;
import java.io.PrintWriter;
import javax.servlet.ServletException;
import javax.servlet.annotation.WebServlet;
import javax.servlet.http.HttpServlet;
import javax.servlet.http.HttpServletRequest;
import javax.servlet.http.HttpServletResponse;

@WebServlet("/getUserInput")

public class GetUserInputServlet extends HttpServlet {

    protected void doPost(HttpServletRequest request, HttpServletResponse response)
        throws ServletException, IOException {

        String username = request.getParameter("username");
        response.setContentType("text/html");
        PrintWriter out = response.getWriter();
        out.println("<html><body>");
        out.println("<h1>Hello, " + username + "!</h1>");
        out.println("</body></html>");
    }
}
```

Lab Task 3: Get Multiple Inputs, Perform Calculation, and Display

Create an HTML form to take inputs for two numbers. Create a Servlet (CalculateSumServlet) to calculate the sum of the numbers and display the result.

HTML Form (calculate.html):

```
<!DOCTYPE html>
```

```
<html>
```

```
<head><title>Sum Calculator</title></head>
```

```
<body>
```

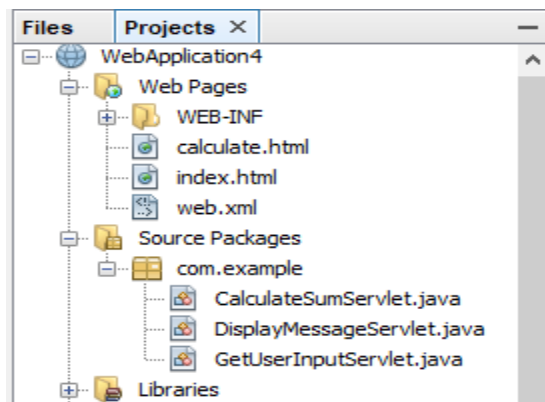

```
<form action="calculateSum" method="POST">
```

```
First Number: <input type="number" name="num1" required><br> Second Number: <input  
type="number" name="num2" required><br> <input type="submit" value="Calculate Sum">
```

```
</form>
```

```
</body>
```

```
</html>
```

Servlet Code (CalculateSumServlet.java):

```
package com.example;

import java.io.IOException;
import java.io.PrintWriter;
import javax.servlet.ServletException;
import javax.servlet.annotation.WebServlet;
import javax.servlet.http.HttpServlet;
import javax.servlet.http.HttpServletRequest;
import javax.servlet.http.HttpServletResponse;

@WebServlet("/calculateSum")

public class CalculateSumServlet extends HttpServlet {

    protected void doPost(HttpServletRequest request, HttpServletResponse response)
        throws ServletException, IOException {

        int num1 = Integer.parseInt(request.getParameter("num1")); int num2 =
        Integer.parseInt(request.getParameter("num2")); int sum = num1 + num2;

        response.setContentType("text/html");

        PrintWriter out = response.getWriter();

        out.println("<html><body>");

        out.println("<h1>The sum of " + num1 + " and " + num2 + " is: " + sum + "</h1>");

        out.println("</body></html>");

    } }
```

Lab Task 4: Java Servlet with Database CRUD Operations

1. **Set up a database** with a table named stock (fields: id, product_name, quantity).
2. **Create a simple web form** to interact with the database (add, update, delete products).
3. **Create a Servlet** (StockManagementServlet) that handles database operations.

Database Setup (MySQL example):

```
CREATE DATABASE stock_management;
```

```
USE stock_management;
```

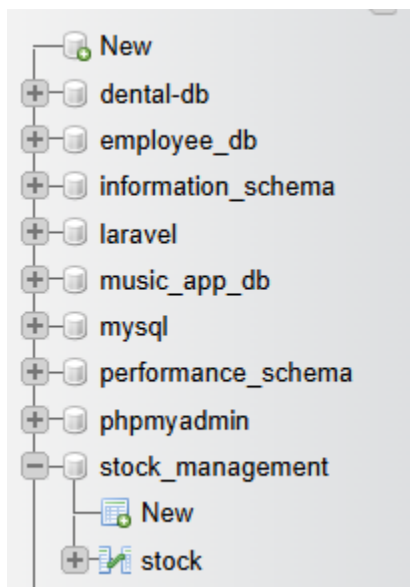

```
CREATE TABLE stock (
```

```
id INT AUTO_INCREMENT PRIMARY KEY,
```

```
product_name VARCHAR(255),
```

```
quantity INT
```

```
);
```

HTML Form (stockForm.html):

```
<!DOCTYPE html>

<html>

<head><title>Stock Management</title></head>

<body>

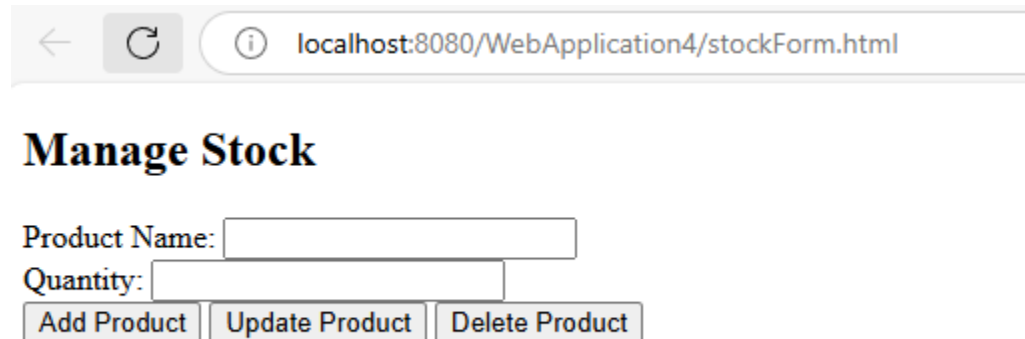

<h2>Manage Stock</h2>

<form action="stockAction" method="POST">

  Product Name: <input type="text" name="product_name" required><br> Quantity: <input
type="number" name="quantity" required><br> <input type="submit" name="action"
value="Add Product"> <input type="submit" name="action" value="Update Product"> <input
type="submit" name="action" value="Delete Product"> </form>

</body>

</html>
```

The screenshot shows a web browser window with the address bar displaying 'localhost:8080/WebApplication4/stockForm.html'. The page content features a heading 'Manage Stock' in a large, bold, black serif font. Below the heading, there is a form with two input fields: 'Product Name:' followed by a text input box, and 'Quantity:' followed by a number input box. At the bottom of the form, there are three buttons: 'Add Product', 'Update Product', and 'Delete Product', each with a light gray background and a thin black border.

Servlet Code (StockManagementServlet.java):

```
package com.example;

import java.io.IOException;
import java.io.PrintWriter;
import java.sql.*;
import javax.servlet.ServletException;
import javax.servlet.annotation.WebServlet;
import javax.servlet.http.HttpServlet;
import javax.servlet.http.HttpServletRequest;
import javax.servlet.http.HttpServletResponse;

@WebServlet("/stockAction")

public class StockManagementServlet extends HttpServlet {

    private Connection getConnection() throws SQLException { String url =
    "jdbc:mysql://localhost:3306/stock_management"; String username = "root";

    String password = "root"; // replace with your database password

    return DriverManager.getConnection(url, username, password); }

    protected void doPost(HttpServletRequest request, HttpServletResponse response)
    throws ServletException, IOException {

    String action = request.getParameter("action");

    String productName = request.getParameter("product_name"); int quantity =
    Integer.parseInt(request.getParameter("quantity"));

    try (Connection conn = getConnection()) {

    switch(action) {

    case "Add Product":

    try (PreparedStatement stmt = conn.prepareStatement( "INSERT INTO stock (product_name,
    quantity) VALUES (?, ?)")) {

    stmt.setString(1, productName);

    stmt.setInt(2, quantity);
```

```

    stmt.executeUpdate();

response.getWriter().write("<h1>Product Added Successfully</h1>");

}

break;

case "Update Product":

    try (PreparedStatement stmt = conn.prepareStatement( "UPDATE stock SET quantity = ?
WHERE product_name = ?")) {

        stmt.setInt(1, quantity);

        stmt.setString(2, productName);

        stmt.executeUpdate();

response.getWriter().write("<h1>Product Updated Successfully</h1>");

    }

break;

case "Delete Product":

    try (PreparedStatement stmt = conn.prepareStatement( "DELETE FROM stock WHERE
product_name = ?")) { stmt.setString(1, productName);

        stmt.executeUpdate();

        response.getWriter().write("<h1>Product Deleted Successfully</h1>");

    }

break;

default:

    response.getWriter().write("<h1>Invalid Action</h1>"); }

    } catch (SQLException e) {

        e.printStackTrace();

        response.getWriter().write("<h1>Database Error: " + e.getMessage() + "</h1>");

    }

} }

```

Lab Task 5: Display Data from Database on Another Web Page

1. Create a Servlet to fetch and display all products from the database.
2. Create a new HTML page to show the product list.

HTML Form (stockForm.html):

```
<html>

<head>  <title>Stock Management</title>

<style>

    body { font-family: Arial, sans-serif; margin: 20px; }

    form { max-width: 500px; margin: 0 auto; padding: 20px; border: 1px solid #ddd; border-
radius: 5px; }

        input[type="text"], input[type="number"] { width: 100%; padding: 8px; margin: 5px 0
15px; }

        input[type="submit"] { padding: 8px 15px; margin-right: 10px; }

        .view-link { display: block; text-align: center; margin-top: 20px; }

</style>

</head>

<body>  <h2 style="text-align: center;">  Manage Stock  </h2>

<form action="stockAction" method="POST">

    Product Name: <input type="text" name="product_name" required><br>

    Quantity: <input type="number" name="quantity" required><br>

    <input type="submit" name="action" value="Add Product">

    <input type="submit" name="action" value="Update Product">

    <input type="submit" name="action" value="Delete Product">

</form>
```

```
<div class="view-link">  
<a href="displayProducts"> View All Products </a>  
</div>  
</body>  
</html>
```

Manage Stock

Product Name:

Quantity:

Add Product

Update Product

Delete Product
